

SmartPublisher

+1 (925) 967-4451 info@vorsutus.com www.vorsutus.com

RSA Archer® provides built-in features and GRC API to allow export of data from your Archer universe, but even with those robust features there is a need to write custom code to derive meaningful subsets of data that maintain their business context.

Business Process Overview

With the SmartPublisher tool you can pick and choose your desired data sets that will automatically be published to the a database target on a schedule of your choosing. Your RSA Archer® administrators can continue to enhance your environment without any impact to your export jobs, so your upstream applications continue to receive the data they need without the need for complex and time-consuming change requests and script modifications.

SmartPublisher Process Flow

Step 1

Identify the data set that needs to be exported and the frequency at which it needs to be exported

Step 2

Set up a SmartPublisher job providing target database, credentials and configuration information

Step 3

Wait for job to execute and use data in target database

Key Benefits and Features

Simple & Easy

Set up SmartPublisher jobs with easy to use interface

Repeatable

Create multiple SmartPublisher jobs without the need to involve infrastructure teams, saving yourself precious time and money

Continue Enhancements

Continue to improve your RSA Archer® configuration without impacting your export jobs

No Custom Coding Required

Once set up, the SmartPublisher does not require any additional custom coding, so you can allocate your resources on more important tasks
